SECTION I: READING COMPREHENSION

READ THE FOLLOWING TEXT AND DO THE RELATED TASKS.

In glowing reports of the new digital technology written by educationalists, one of the most prominent buzzwords is: autonomy. Digital technology is great for learner autonomy, we hear. But is it? Of course, there are a thousand and one new things that you can do with the new technology in school; but does that really mean that the new technology marks some sort of revolution so that now, for the first time in history, learners can at last become autonomous? To answer that question we need to demonstrate the connection between the new technology and student freedom. Professor Sugata Mitra shows how once a school has the internet, the teacher can effectively step aside and let the children educate themselves. Mitra is one of the great spokespeople for the strange movement in education that is hostile to the very notion of teaching. Education is good. Learning is fantastic, especially when it involves individuals and small groups pursuing their own interests, preferably searching for information on the internet. Teaching, though, is something we need to be very, very wary of. Unless we are very, very careful to adopt a minimal, low-key, hands-off approach to this piping hot potato of pedagogy, we will be guilty of indoctrination.

One of the mystifications Mitra lends support to is the idea that the only threat to our freedom comes from people. Flesh and blood tyrants are the only enemies of freedom; and in education the tyrants are the teachers – those megalomaniacs who insist on telling the students what the answers are. His Hole in the Wall project provides an inspiring image for the anti-teacher teachers: a teacherless space in which children learn on their own (surfing the web). Of course there is still a need for teachers to set this space up and to supervise what takes place there; but this will be "minimally invasive teaching". Mitra's term is interesting. It implies that all teaching is "invasive" – a word full of negative connotations. Teaching is prima facie bad. The best that can be hoped for in teaching is to keep that badness to a minimum.

For instance, he says: "If the stuff is on Google, why do you need to stuff it into your head?" All you need to learn is how to access and evaluate the information. The digital learners but ignorant fact-finders are free to find bits of knowledge; but they have been dispossessed of all knowledge which is now stored online. For instance, Mitra wants to make rational thinking one of the three planks of primary education (the others being reading comprehension and information search skills). To keep things suitably minimal, the teacher would have to appear neutral, letting the students find their own set of values. The minimally rationalist teacher will doubtless prompt the students to defend their chosen value systems, but will avoid creating the impression that more educated members of society believe that some value systems are better than others lest the minimally invasive outdoctrination slip back into nasty old indoctrination.

Mitra comes close to affirming the exact opposite of what he intends. He wants to affirm that the learner is not a tabula rasa. Learning happens when the learner reconstructs the knowledge for him or herself. But because the knowledge is already on the internet, it is easy for learners to feel that there is no point in bothering with the difficult work of reconstruction. But when the learners are happy to selectively copy and paste, rather than reconstruct the knowledge and make it their own, they start to approximate the dreaded tabula rasa.

One more mystification: the idea that autonomy is easy. This is the same idea seen in the liberal natural rights discourse (which talks of people being born free). The children are free, so all the teacher needs to do is let them exercise their freedom, and what better way to do that than let them find the answers to questions online. The autonomous learner has to believe that learning matters. Does the internet help or hinder that? Obviously it is a huge hindrance. The internet is great at encouraging young people to play games, to chat, to watch videos, and to shop. It's not so hot at encouraging them to learn something beyond the mechanics of life online and to explore the world that they live in and have inherited. Students on the road to autonomy need a deeper understanding of themselves as beings who can make sense of the world.

Autonomous students need to be productive. Of course, at first sight, the internet widens the opportunities for publishing work. The sheer size of the internet, which can initially seem such a plus, can end up being discouraging. Autonomy is nothing without the super-ego - that little tyrant within us. Here, the internet is a bad influence. For instance, it sends out a clear message to young people that whatever they publish online needs to be short and easily digestible. It is also a place that rewards copying and retweeting tweets. Here teachers and schools need to intervene and inspire their students to produce work of greater length and depth, not work that has been pieced together from stuff found online. Schools will have to praise and reward work that shows originality and signs of an independent mind.

The new generation, raised on TV and the personal computer has become unmoored from the mother ship of culture. When students are sent off looking for facts on the internet, it is not hard for them to start seeing which facts are more factual than others; but when it comes to questions of value, they are more than likely to despair or fall back on some unreflective framework of meaning that they have picked up along the way.
